SAFETY SYSTEMS

CASE STUDY

Kee Steps Installation at Livingston Designer Outlet

APS Safety Systems was approached by a specialist roofing and cladding contractor requiring a safe access solution for planned works at Livingston Designer Outlet. Multiple rooftop obstacles, including ducting and pipework, made it difficult for operatives to move safely between working areas. APS reviewed the roof layout, obstructions and required traffic routes to determine the most suitable permanent access solution.

SAFETY SYSTEMS

SOLUTION:

APS recommended and installed Kee Step modular access systems, providing dedicated routes over the rooftop obstacles. The step-over units allow operatives to safely navigate ducting and pipework without climbing directly over or coming into unnecessary contact with existing services. Their modular design enabled each system to be configured around the specific roof layout and access requirements.

OUTCOME:

The completed installation provides a safer and more efficient way for operatives to navigate the roof, improving access to areas required for planned and future works. The dedicated Kee Step routes also help reduce the risk of accidental damage to rooftop services while removing the need for temporary access arrangements, providing a robust and practical long-term solution.
